

# Formatting Dates

## Dynamic Parameter Date UI

The dynamic parameter syntax `#{label,type,default}` now supports date as a choice. The allowed syntax for the type component can be any of the following:

```
date // system locale, long format
```

```
date() // system locale, long format
```

```
date(fr) // french locale, long format
```

```
date(fr_CA) // french-canadian locale, long format
```

```
date(fr_CA_qu) // french canadian in quebec (made this up), long format
```

```
date("long") // system locale, long format
```

```
date("medium") // system locale, medium format
```

```
date("short") // system locale, short format
```

```
date("(yyyy) MM/dd"); // system locale, custom format
```

Combining the two:

```
date(fr,"short") // french locale, short format
```

etc. All combinations should work.
