

# Invoking Sections

Sections can be enabled / disabled sections during runtime. The following code snippets demonstrate how to retrieve a dynamic parameter to determine the sections to be rendered :

(Written at the report template, '**On Render Begin**' of the Report)

=Code Snippet =

```
//Get the list of sections
```

```
reportList = this.getSectionList();
```

```
ltIter = reportList.listIterator();
```

```
while (ltIter.hasNext())
```

```
{
```

```
tempString = (ltIter.next()).toString();
```

```
tempFlag = "True";
```

```
//Retrieve parameter and pass in to StringTokenizer to separate the string, ',' is the  
delimiter
```

```
st = new java.util.StringTokenizer
```

```
(Properties.getProperty("ListOfSections"),",");
```

```
//Enable / Disable Section
```

```
while (st.hasMoreTokens())
```

```
{
```

```
if(tempString.equals(st.nextToken()))
```

```
{
```

```
tempFlag = "False";  
    }  
}  
if(tempFlag.equals("True"))  
{  
    ltIter.remove();  
}  
}
```

Sample parameter pass-in : Section 1, Section 2

Parameters passed in are separated by **!StringTokenizer()** and the for loop sets the flag to enable the sections.

For more information, [see the attached zip file](#).
