

Sharing Scripts

Each report has a Function Definitions editor (on the Functions tab) in the Report Designer. Any code here will be run before the report is rendered.

To share code across reports, create a JavaScript file in the repository (**Add>JavaScript** is on the repository folder popup menu) and place the common code here.

Navigate to the Function Definitions for each report and add a line:

=Code Snippet=

```
importScript("/ElixirSamples/path/to/my.js");
```

with the appropriate path to your .js file.
