

Single Sign On to Ambience From an Application

The following web link explains the SSO process which logs in a user to the Ambience server from the application, along with the code fragment (SSO_demo) and a new evaluation licence which you will need to enable SSO user authentication. For this sample, you will need to compile and export the code sample to a WAR file and deploy it to a web server, e.g. Apache.

After successful deployment, you should be directed to the Ambience index page from your web server.

See <http://docs.elixirtech.com/Ambience/4.0.0/Programming-Interfaces/html-multi/ch03.html> for more information.
