

# IBM Websphere Portal

WebSphere Portal provides a centralized online platform that enables organizations to create a gateway for their staff or customers to access their various web sites via a single URL. This is enabled through the use of portlets. Each portlet serves as a container to display the desired web content. The use of portlets enables sections of the Repertoire Server to be displayed.

The following document serves as an internal report on the integration of Elxir Repertoire Server with IBM WebSphere Portal.

The platforms used are as follows:

- Elixir Repertoire Server 7.1.1
- WebSphere Portal 5.1.0
- Rational Application Development Platform 6
- Eclipse 3.3
- Apache Tomcat 6.0.13
