

# Custom Flash Components

For version 7.5.x and above

Dashboard now allows the addition of flash components. These flash components can be customized using flex programming and exposed on the dashboard for flexible usage. This page will contain some working samples of such components that can be readily used.

**Usage** - Drag the .swf component from your repository and drop them onto the dashboard's canvas. You will need to ensure that these components are properly coded to read our datasources, action events etc. Once this is done, you can then expose the various parameters to be used easily on the dashboard.

## Examples

1. [Slider Control](#)
2. [iLog Components](#)

## Documentation and Tutorials

Additional documentation and self-tutorials can be found here :
