Linefeed into an XML Attribute

By default, XML attributes do not allow linefeed. This is an XML feature called "attribute value normalization". This is a built-in XML specification that is a default setting and cannot be changed.

There are two solutions to the problem:

1. The first solution to add a linefeed into an attribute value is to use "&10" into the required source code. An example is shown in original.zip.

- original.zip sample contains 3 files including the ds, rml & xml files that present the usage of "&10".

2. A better solution is to set the specific value as an element content. An example is shown in modified.zip.

- modified.zip sample contains 3 files including the ds, rml & xml files that present the usage of element content.
